- [Narrator] Tinnitus causes people to hear sounds with no external source.

Miracle-Ear hearing aids

offer three different built-in programs that can help you control your tinnitus.

Your provider can help you determine which program is best for you.

Static noise is designed to distract from tinnitus.

By mixing a static sound with the tinnitus sound, this feature helps divert your attention from the ringing noise.

The soothing sounds of ocean waves mask tinnitus for a relaxing, stress-free form of treatment.

Notch therapy trains your brain to ignore the tinnitus sound.

Unlike traditional sound therapy, this state-of-the-art technology is inaudible and works to amplify incoming sound while leaving out the frequency of tinnitus.

This method reduces your perception of tinnitus and may even make it disappear.
